JAPAN WALNUT

Plant walnut trees to-day
and insure a staple food for to-morrow

ORNAMENTAL
TO-DAY

USEFUL
TO-MORROW

VALUABLE
FOREVER

A fruit crop may be a failure
but a nut crop never

KESO NURSERIES
CLINTON, CONN.

The Japan Walnut is a nut far superior to any nut except the English Walnut and is superior to this in all ways except that the shell of the Japan Walnut is a little thicker than that of the English Walnut.

The Japan Walnut tree grows nearly ten times as fast as the English Walnut and bears at the age of four or five years. It is a very prolific tree and bears fine nuts in clusters from eight to twelve in abundance. The Japan Walnut is by far the best tree to plant for nut production alone.

The parent tree shown in the picture above is fourteen years old. It has borne nuts since it was four years old. The crop this year, as near as can be estimated, is well over six bushels. The tree has a spread of over one hundred feet.

This year the price of these nuts as they fall from the tree is three dollars a bushel, or eighteen dollars for the product of this tree. One thousand of these trees would mean an income of eighteen thousand dollars per year.

The picture shown below is a three year old tree from this parent tree. This tree has been placed in very sandy soil and is making fine growth.

The Japan Walnut like all oriental stock does better in fine, rich soil such as hen yards, along stone wall fences etc. I have seen four year old Japan Walnut trees twenty and twenty-five feet tall.

A few of these trees with their beautiful foliage will add not only to the beauty of your place but also to the size of your pocketbook. A few dollars invested in these trees now will bring more than four per cent to-morrow.

The proper use of nuts is not generally understood. They are usually used as a delicacy, whereas they are a most concentrated food. Careful experiments have shown that they will successfully replace meat in the diet even of such animals as wolves and tigers. The food value of nuts from an acre of ground is about four times that of the beef that can be produced on the same ground, and nut growing seems destined to solve the problem of the diminishing supply of meat and the increasing demand for it. Probably the most practical use of nuts is to partially replace meat rather than to replace it altogether. At the present time when food is of such paramount importance, it is not strange that there is a steadily increasing interest in nut growing and the use of nuts as food.
